

Suleyman Kiani

Software Engineer · Fintech & Finance Platforms

Burlington, ON | +1 (289) 788-8260 | suley.kiani@outlook.com | [LinkedIn](#) | github.com/kianis4 | suleyman.io

SUMMARY

Software engineer who builds the tooling a finance desk actually runs on: a production quoting engine matching TValue, the industry lease-math standard, to the penny; a multi-tenant booking-and-payments platform processing real client revenue; a self-hosted multi-agent system automating funding-deal document work. Equipment-finance experience at Mitsubishi HC Capital gives me domain fluency most engineers don't have. Finishing an MEng in Computing & Software at McMaster.

EXPERIENCE

Associate Account Manager, Equipment Finance

Sept. 2025 – Present

Mitsubishi HC Capital Canada

Burlington, ON

- *Hybrid role: a sales book plus the desk's internal software (quoting, document automation, collections analytics).*
- Rebuilt **13 abandoned Excel calculators** (30–45 sheets each) as one Next.js / React web app covering all 11 product lines; reverse-engineered each manufacturer's lease and subsidy math and pinned **penny-parity with TValue** under 72 automated tests.
- Untangled three structurally different subsidy formulas, proved three regional dealer workbooks were re-skins of one template, and collapsed them into shared calculation engines; authored the architecture and handoff documentation that lets the company's IT org own and extend the tool.
- Built an AI document-validation prototype (OCR + ML + rules) for deal-funding review and took it through the company's first internal innovation review; it now runs as a live email service that audits real deal packages unattended.
- Designed a predictive collections scorecard with the credit and portfolio teams: a dual-track model that auto-triages low-risk accounts and scores the rest by recovery priority across about **\$17–18M** of assets in recovery; each one-point lift in the portfolio recovery rate is worth about **\$1M**. Owned the business case, won approval, now drive the phased rollout.
- Turned the desk's most repetitive document work (power-of-attorney, asset-registration, and pre-funding packages) into email-triggered services that reply **within minutes** with ready-to-file documents.
- Carry the desk's sales book: funded **\$4M against a \$2M monthly target** in each of April and May 2026; exceeded quota every month since my second month.

Founder & Software Engineer

Jan. 2024 – Present

SKomp Studio

Remote

- Founded a software studio and designed, shipped, and now operate its flagship client platform, **Solstice Pilates**, solo: a multi-tenant booking-and-payments system (**37-model Prisma schema, 106 API routes**) with scheduling, FIFO waitlists and capacity gating, Square payments and recurring memberships with tax handling, digital waivers, and a 23-page admin portal.
- Runs live operations (**500+ registered users, \$40K+ CAD processed** since launch) and ships a client-driven roadmap on **1,600+ automated tests**, including 70 Playwright e2e specs against every Vercel preview, shadow-DB checks across all 49 versioned migrations, and Gitleaks secret scanning in CI.
- Engineered for money-handling correctness: idempotent Square payment processing, webhook signature verification, and row-level tenant isolation via a scoped Prisma client.
- Landed five production fixes in parallel in one agent-orchestrated session, each in its own git worktree with its own test-and-verify loop, merged through branch-protected PRs.
- Coached **100+ learners** through algorithms, systems design, and technical-interview prep in the studio's mentorship arm, alongside the client work.

Junior Web Developer

May 2021 – Jun. 2022

Giftcash Inc.

Remote

- Migrated a legacy Python / Django monolith to Node.js on AWS Lambda, trading always-on server overhead for per-request billing, and tuned PostgreSQL with indexing, caching, and query rewrites that killed the sequential scans on the gift-card lookup.
- Automated gift-card balance verification with a Puppeteer + Axios pipeline and stood up Jenkins and GitHub Actions CI/CD so merges deployed without manual release steps.

PROJECTS

- Personal Agentic OS** · multi-agent automation platform | *Python, TypeScript, Claude, systemd, Tailscale* 2026
- Operate the self-hosted multi-agent platform behind the document services above: **30+ scheduled automations** and email-triggered workers that validate funding-deal packages and draft the finished documents in minutes.
 - Every untrusted worker runs in a kernel-namespace sandbox behind fail-closed gates; secrets live in a 1Password service-account vault; encrypted off-site backups run nightly; a health watchdog emails on problem-state transitions.
 - Runs an autonomous overnight pipeline that picks a candidate idea, builds and tests it in an isolated git worktree, and publishes behind a **12-check security gate**; monitored from a custom SwiftUI iOS app and web dashboards over a private Tailscale mesh.
 - Includes a fully local RAG stack (qwen2.5 on an RTX 3080) returning cited answers in **about 4s** at zero API cost, and a Whisper voice-note router that files each note to the right project, tuned by an eval harness against Recall@10.
- Mike Ross AI** · legal RAG assistant (Delta Hacks 12) | *LangGraph, Gemini 2.0, MongoDB Atlas, FastAPI* 2026
- Built a legal assistant that answers Canadian-law questions with section-level citations: a LangGraph state machine routes intent, runs hybrid keyword + vector retrieval over **16,000+ legal documents** (MongoDB Atlas, HNSW indexing), and returns schema-validated output to block hallucination.
 - Wired Gemini 2.0 Flash to a FastAPI backend streaming over SSE into a Next.js 16 frontend; live at mike-ross.ca.
- Applify AI** · resume-tailoring SaaS | *Next.js, Inngest, OpenAI* 2025 – Present
- Production SaaS that tailors a resume to a job posting: event-driven background jobs (Inngest) run the analysis pipeline against the OpenAI Responses API; cut inference cost about **90%** with prompt caching.
- suleyman.io** · personal site built as a product | *Next.js 16, Prisma, Neon, Vercel* 2026
- The site is a command-center HUD with a working in-browser terminal (custom REPL, commands and games), live Spotify visualizations, a GitHub-language constellation fed by the GitHub API, and a database-backed resume pipeline serving versioned resume variants from Postgres.
- OverloadPT** · iOS strength-training app | *Swift, SwiftUI, SwiftData, Combine* 2025
- Shipped an iOS app in Swift / SwiftUI (MVVM + Coordinator) with a progressive-overload engine that recommends weight increases and flags plateaus from a lifter's training history; workout data modeled with SwiftData and Combine.

TECHNICAL SKILLS

Languages: TypeScript, Python, SQL, Java, C, Swift

Financial & Domain: Equipment & lease finance, amortization math (PMT/PV/FV/RATE/IRR, TValue-validated), manufacturer subsidy & blended-rate modeling, credit-scorecard & recovery modeling, deal-funding workflows

Backend & Web: Next.js (App Router, Server Actions), React, Node.js, FastAPI, Prisma, Tailwind, PostgreSQL (Neon), Redis, Vercel, REST APIs

AI / Agentic: Multi-agent orchestration, local LLM serving (Ollama, qwen2.5), RAG + reranking, Whisper transcription

Payments & Integrations: Square (orders, payments, webhooks), Meta CAPI, Google Ads server-side conversions, Gmail / Workspace API

Practices: TDD (Vitest, Playwright), CI/CD, branch-protected PRs, systemd automation, multi-tenant SaaS

EDUCATION

McMaster University

Hamilton, ON

MEng, Computing & Software

Sept. 2025 – Expected Dec. 2026

- Year 1 complete: **A+** in Simple Type Theory and Microservices-Oriented Architectures.
- Research with Dr. Farmer and Dr. Paige: an LLM-based study companion pairing retrieval over course material with locally served models.
- Built **PodcastHub** for the distributed-systems course: six event-driven microservices (Node/Express, Python/FastAPI) choreographed over a RabbitMQ topic exchange with MinIO object storage and FFmpeg media processing.

McMaster University

Hamilton, ON

BASc (Honours), Computer Science

Sept. 2018 – Nov. 2024
